Standard Test Methods for
Time of Setting of Hydraulic Cement by Vicat Needle

This standard is issued under the fixed designation C 191; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 These test methods determine the time of setting of hydraulic cement by means of the Vicat needle. Two test methods are given; Method A is the Reference Test Method using the manually operated standard Vicat apparatus, while Method B permits the use of an automatic Vicat machine that has, in accordance with the qualification requirements of this method, demonstrated acceptable performance.

1.2 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.3 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use. See 1.4 for a specific warning statement.

1.4 Warning—Fresh hydraulic cementitious mixtures are caustic and may cause chemical burns to skin and tissue upon prolonged exposure. The use of gloves, protective clothing, and eye protection is recommended. Wash contact area with copious amounts of water after contact. Wash eyes for a minimum of 15 min. Avoid exposure of the body to clothing saturated with the liquid phase of the unhardened material. Remove contaminated clothing immediately after exposure.¹

1.5 The text of this standard references notes and footnotes which provide explanatory material. These notes and footnotes (excluding those in tables and figures) shall not be considered as requirements of the standard.

Note 1—For the method for determining the time of setting by Gillmore needles, see Test Method C 266.

2. Referenced Documents

2.1 ASTM Standards: ³

- C 151 Test Method for Autoclave Expansion of Hydraulic Cement
- C 183 Practice for Sampling and the Amount of Testing of Hydraulic Cement
- C 187 Test Method for Normal Consistency of Hydraulic Cement
- C 219 Terminology Relating to Hydraulic Cement
- C 266 Test Method for Time of Setting of Hydraulic-Cement Paste by Gillmore Needles
- C 305 Practice for Mechanical Mixing of Hydraulic Cement Pastes and Mortars of Plastic Consistency
- C 511 Specification for Mixing Rooms, Moist Cabinets, Moist Rooms, and Water Storage Tanks Used in the Testing of Hydraulic Cements and Concretes
- C 595 Specification for Blended Hydraulic Cements
- C 1157 Performance Specification for Hydraulic Cement
- D 1193 Specification for Reagent Water

3. Terminology

3.1 Definitions—The terms used in this test method are defined in accordance with Terminology C 219.

4. Summary of Test Method

4.1 A paste that is proportioned and mixed to normal consistency, as described in the Test Method C 187, is molded and placed in a moist cabinet and allowed to start setting. Periodic penetration tests are performed on this paste by allowing a 1-mm Vicat needle to settle into this paste. The Vicat initial time of setting is the time elapsed between the initial contact of cement and water and the time when the penetration is measured or calculated to be 25 mm. The Vicat final time of setting is the time elapsed between initial contact of cement and water and the time when the needle does not leave a complete circular impression in the paste surface.

5. Significance and Use

5.1 This test method provides a means of determining compliance with a specification limit for Vicat time of setting. Refer to the appropriate specification for the cement to determine if this test method is used for specification compliance.

¹ These test methods are under the jurisdiction of ASTM Committee C01 on Cement and is the direct responsibility of Subcommittee C01.30 on Time of Set.
⁴ For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For Annual Book of ASTM Standards volume information, refer to the standard’s Document Summary page on the ASTM website.

*A Summary of Changes section appears at the end of this standard.

5.2 Time of setting measured by this method will not necessarily provide the same results as the time of setting of hydraulic cement paste measured by other methods, or the time of setting of mortar or concrete.

6. Apparatus

6.1 Vicat Apparatus—See Annex A1.1 and Fig. A1.1. The Vicat apparatus for this test method shall have a movable rod, B, of mass 300 ± 0.5 g.

6.1.1 The end of the rod used for measuring penetration shall have a straight steel removable needle with a diameter of 1.00 ± 0.05 mm and length no less than 50 mm.

6.1.2 The needle end that contacts the specimen shall be flat, plane, and at right angles to the axis of the rod.

6.2 Reference Masses and Devices for Determining Mass, conforming to the requirements of Specification C 1005. The devices for determining mass shall be evaluated for precision and accuracy at a total load of 1000 g.

6.3 Glass Graduates, 200 or 250-mL capacity, and conforming to the requirements of Specification C 1005.

6.4 Plane non-adsorptive plate, 100 ± 5 mm square of similar planeness, corrosivity, and absorptivity to that of glass (see Annex A1.1, Fig. A1.1, G).

6.5 Flat trowel, having a sharpened straight-edged steel blade 100 to 150 mm in length. The edges when placed on a plane surface shall not depart from straightness by more than 1 mm.

6.6 Conical ring, made of a rigid, non-corroding, non-absorbent material and having a height of 40 ± 1 mm, an inside diameter at the bottom of 70 ± 3 mm, and an inside diameter at the top of 60 ± 3 mm (see Annex A1.1, Fig. A1.1, G).

6.7 Mixer, bowl, and paddle, conforming to Practice C 305.

6.8 Automatic Vicat Needle Apparatus for Method B—The apparatus shall be equipped with a Vicat needle as described in 6.1.1 and 6.1.2. The total mass supported by the needle tip at the time of measurement shall be 300 ± 0.5 g. The instrument shall be capable of automatically completing and recording penetration measurements of a test specimen at predetermined time intervals not exceeding 10 min and make each penetration test at least 5 mm away from any previous penetration and at least 10 mm away from the inner side of the mold.

6.9 Specimen Mold for Method B—The cement paste is held in a conical ring with the height of 40 ± 1 mm and a removable base plate. The test surface shall have a minimum diameter of 60 ± 3 mm.

6.10 Inspect and document Section 6 apparatus for conformance to the requirements of this test method at least every 2 1/2 years.

7. Reagents and Materials

7.1 Mixing Water—Potable water is satisfactory for routine tests. Use water conforming to the requirements of Specification D 1193 for Type III or Type IV grade reagent water for all referee and cooperative tests.

8. Sampling

8.1 When the test is required for acceptance testing, sample cement in accordance with Practice C 183.

9. Conditioning

9.1 Maintain the temperature of the air in the vicinity of the mixing slab, the dry cement, molds, and base plates at 23.0 ± 3.0 °C.

9.2 Maintain the temperature of the mixing water at 23.0 ± 2.0 °C.

9.3 The relative humidity of the mixing room shall be not less than 50%.

9.4 The moist cabinet or moist room shall be in accordance with Specification C 511.

10. Preparation of Cement Paste

10.1 The cement paste used for the determination of the time of setting is obtained from one of the following methods:

10.1.1 Prepare a new batch of paste by mixing 650 g of cement with the percentage of mixing water required for normal consistency (Test Method C 187), following the procedure described in Practice C 305.

10.1.2 For method A, at the option of the tester, use the test specimen used for determining normal consistency (see Note 2).

10.1.3 At the option of the tester, use the paste remaining from the batch used for the autoclave specimen (Test Method C 151) or from the normal consistency determination (Test Method C 187).

Note 2—The specimen used for the determination of the normal consistency will have an irregular surface, making it unsuitable for method B.

11. Calculation

11.1 Calculate the Vicat time of setting to the nearest 1 min as follows:

\[
\text{C} = \left( \frac{(H-E)}{(C-D)} \right) \times (C-25) + E
\]

where:

- \(E\) = time in minutes of last penetration greater than 25 mm,
- \(H\) = time in minutes of first penetration less than 25 mm,
- \(C\) = penetration reading at time \(E\), and
- \(D\) = penetration reading at time \(H\).

11.2 Calculate the Vicat final time of setting by determining the elapsed time between the time of the initial contact between cement and water and the time when the needle does not sink visibly into the paste, rounded to the nearest 5 min.

12. Report

12.1 Report the time of setting and the method used as follows:

\[
\begin{align*}
\text{Vicat time of setting (A or B)} & \quad \text{min} \\
\text{Vicat final time of setting (A or B)} & \quad \text{min}
\end{align*}
\]

Method A—Manual Vicat Needle Apparatus

13.1 Refer to the Apparatus section, paragraphs 6.1, 6.4, and 6.6, and Annex A1 for a description of the Vicat apparatus.

---

4 See Test Method C 187.
14. Procedure A

14.1 Molding Test Specimen—Quickly form the cement paste, as described in the section on preparation of cement paste, into a ball with gloved hands and toss six times from one hand to the other, maintaining the hands about 150 mm (6 in.) apart. Press the ball, resting in the palm of the hand, into the larger end of the conical ring, G, Fig. A1.1, held in the other hand, completely filling the ring with paste. Remove the excess at the larger end by a single movement of the palm of the other hand, smoothing the top of the specimen, if necessary, with one or two light touches of the pointed end of the trowel. During the operation of cutting and smoothing, take care not to compress the paste. Immediately after molding, place the test specimen in the moist cabinet or moist room and allow it to remain there except when penetration measurements are being made. The specimen shall remain in the conical mold, supported by the non-absorptive plate throughout the test period.

14.2 Time of Setting Determination—Allow the time of setting specimen to remain in the moist cabinet or moist room for 30 min after molding without being disturbed. Determine the penetration of the 1-mm needle at this time and every 15 min thereafter (every 10 min for Type III cements) until a penetration of 25 mm or less is obtained. Perform the penetration test by lowering the needle D of the rod B until it rests on the surface of the cement paste. Tighten the setscrew, E, and set the indicator, F, at the upper end of the scale, or take an initial reading. Release the rod quickly by releasing the set screw, E, and allow the needle to settle for 30 s; then take the reading to determine the penetration. At the option of the tester, if the paste is obviously quite soft on the early readings, retard the fall of the rod to avoid bending the 1-mm needle, but when actual penetration measurements to determine the time of setting are made, release the rod only by the setscrew. Make each penetration test at least 5 mm away from any previous penetration and at least 10 mm away from the inner side of the mold. Record the results of all penetration tests and, by interpolation, determine the time when a penetration of 25 mm is obtained. The elapsed time between the initial contact of cement and water and the penetration of 25 mm is the Vicat time of setting or Vicat initial time of setting.

14.3 Determine the Vicat final time of setting end point to be the first penetration measurement that does not mark the specimen surface with a complete circular impression. Verify final set by performing two additional penetration measurements on different areas of the specimen surface. Obtain verification measurements within 90 s of the first “final set” measurement. The elapsed time between the initial contact of cement and water and the end point determination above is the Vicat final time of setting.

14.4 Precautions—Keep all the apparatus free from vibration during the penetration test. Keep the 1-mm needle straight and clean. The needle must be kept clean to prevent cement from adhering to the sides of the needle and decreasing penetration, and to prevent cement from adhering to the point and increasing penetration.

15. Precision and Bias

15.1 Precision:

15.1.1 The single-operator (within-laboratory) standard deviation has been found to be 12 min for the initial time of setting, throughout the range of 49 to 202 min, and 20 min for the final time of setting throughout the range of 185 to 312 min. Therefore, results of two properly conducted tests by the same operator on Vicat initial time of setting of similar paste should not differ from each other by more than 34 min and on Vicat final time of setting of similar pastes should not differ from each other by more than 56 min.

15.1.2 The multilaboratory (between-laboratory) standard deviation has been found to be 16 min for the initial time of setting throughout the range of 49 to 207 min, and 43 min for the final time of setting throughout the range of 185 to 312 min. Therefore, results of two properly conducted tests from two different laboratories on Vicat initial time of setting of similar pastes should not differ from each other by more than 45 min, and on Vicat final time of setting of similar pastes should not differ from each other by more than 122 min.

15.2 Bias—Since there are no accepted reference materials suitable for determining the bias for the procedure in this test method, no statement on bias is presented.

Method B—Automatic Vicat

16. Automatic Vicat Apparatus

16.1 Automatic Vicat Needle Apparatus—Refer to the Apparatus section, paragraphs 6.8 and 6.9, for a description of the Automatic Vicat needle apparatus.

17. Procedure

17.1 Molding the Specimen—Quickly form the cement paste, as described in the section on preparation of cement paste, into a ball with gloved hands and toss six times from one hand to the other, maintaining the hands about 150 mm apart. Press the ball, resting in the palm of the hand, into the larger end of the conical ring, held in the other hand, completely filling the ring with paste. Remove the excess at the larger end by a single movement of the palm of the hand. Place the ring on its larger end onto the non-absorptive plate, H, and slice off the excess paste at the smaller end at the top of the ring by a single oblique stroke of the trowel held at a slight angle with the top of the ring. Smooth the top of the specimen, if necessary, with one or two light touches of the pointed end of the trowel. During the operation of cutting and smoothing, take care not to compress the paste. Immediately after molding, place the test specimen in the moist cabinet or moist room and allow it to remain there except when penetration measurements are being made. The specimen shall remain in the conical mold, supported by the non-absorptive plate throughout the test period.
